[Q40. What do you think is more important...Trying to help control the spread of the coronavirus, even if it hurts the economy OR Trying to help the economy, even if it hurts efforts to control the spread of the virus](#)

[Q41. What do you think is more important...Trying to help control the spread of the coronavirus, even if public education has to take place over the internet with children at home OR Children being taught in person at their public schools, even if it hurts efforts to control the spread of the coronavirus](#)

[Q42. When do you think the coronavirus will be contained in the U.S. to the point that most activities like social gatherings, workplaces, and sporting events can return to normal?](#)

[Q43A. If a vaccine to prevent coronavirus infection were widely available at a low cost, would you try to get that vaccine, or not?](#)

[Q43B. Do you think that a coronavirus vaccine will be made available before it is proven safe and effective?](#)

[Q44. Would you say that the quality of K-12 public school education in Texas is:](#)

[Q45. And would you say the quality of K-12 public school education has improved, stayed about the same, or gotten worse since the beginning of the COVID-19 pandemic?](#)

[Q46A. How safe do you feel in the area where you live?](#)

[Q46B. Thinking about police departments in your area, do you think that spending on policing should be...](#)

[Q47. Do you think the recent attention paid to the treatment of black people by police will help improve race relations in the United States, make them worse, or won't really change them?](#)

[Q48. Do you think the deaths of African Americans during encounters with police in recent years are...](#)

[Q48A. How closely have you been following efforts to fill the seat of Supreme Court Justice Ruth Bader Ginsburg, who recently passed away?](#)

[Q48B. Which of the following is closest to your opinion?](#)

[Q49A. Please tell us whether you would strongly support, somewhat support, somewhat oppose, or strongly oppose the following proposals related to immigration policy: *Passing an English-only amendment to the Texas constitution.*](#)

[Q49B. Please tell us whether you would strongly support, somewhat support, somewhat oppose, or strongly oppose the following proposals related to immigration policy: *Ending bilingual education in Texas public schools.*](#)

[Q49C. Please tell us whether you would strongly support, somewhat support, somewhat oppose, or strongly oppose the following proposals related to immigration policy: *Ending bilingual versions of ballots in elections.*](#)

[Q50A. Do you agree or disagree with each of the following statements:*Society as a whole has become too soft and feminine.*](#)

[Q50B. Do you agree or disagree with each of the following statements:*Efforts to increase diversity almost always come at the expense of whites.*](#)

[Q50C. Do you agree or disagree with each of the following statements:*God has granted America a special role in human history.*](#)

Sampling and Weighting Methodology for the October 2020 Texas Statewide Study

For the survey, YouGov interviewed 1482 Texas registered voters between September 25 and October 4, 2020, who were then matched down to a sample of 1200 to produce the final dataset. The respondents were matched on gender, age, race, and education. YouGov then weighted the matched set of survey respondents to known characteristics of registered voters of Texas from the 2018 Current Population survey and 2014 Pew Religious Landscape Survey.

The respondents were matched to a sampling frame on gender, age, race, and education. The frame was constructed by stratified sampling from the full 2018 Current Population Survey (CPS) voter registration supplement with selection within strata by weighted sampling with replacements (using the person weights on the public use file). For the main sample, the matched cases were weighted to the sampling frame using propensity scores. The matched cases and the frame were combined and a logistic regression was estimated for inclusion in the frame. The propensity score function included age, gender, race/ethnicity, and years of education. The propensity scores were grouped into deciles of the estimated propensity score in the frame and post-stratified according to these deciles. These weights were then post-stratified on baseline party identification, the 2016 presidential vote, ideology, and a full stratification of four-category age, four-category race, gender, and four-category education. The weights were trimmed at 7 and normalized to sum to the sample size.

The margin of error of the weighted data for registered voters is 2.8% for registered voters and 3.25% for likely voters (if adjusted for weighting, the margin of error for registered voters is 3.8%, 4.1% for likely voters).

Survey Panel Data

The YouGov panel, a proprietary opt-in survey panel, is comprised of 1.5 million U.S. residents who have agreed to participate in YouGov Web surveys. At any given time, YouGov maintains a minimum of five recruitment campaigns based on salient current events.

Panel members are recruited by a number of methods and on a variety of topics to help ensure diversity in the panel population. Recruiting methods include Web advertising campaigns (public surveys), permission-based email campaigns, partner sponsored solicitations, telephone-to-Web recruitment (RDD based sampling), and mail-to-Web recruitment (Voter Registration Based Sampling).

The primary method of recruitment for the YouGov Panel is Web advertising campaigns that appear based on keyword searches. In practice, a search in Google may prompt an active YouGov advertisement soliciting opinion on the search topic. At the conclusion of the short survey respondents are invited to join the YouGov panel in order to receive and participate in additional surveys. After a double opt-in procedure, where respondents must confirm their consent by responding to an email, the database checks to ensure the newly recruited panelist is in fact new and that the address information provided is valid.

The YouGov panel currently has over 20,000 active panelists who are residents of Texas. These panelists cover a wide range of demographic characteristics.

Sampling and Sample Matching

Sample matching is a methodology for selection of “representative” samples from non-randomly selected pools of respondents. It is ideally suited for Web access panels, but could also be used for other types of surveys, such as phone surveys. Sample matching starts with an enumeration of the target population. For general population studies, the target population is all adults, and can be enumerated through the use of the decennial Census or a high-quality survey, such as the American Community Survey. In other contexts, this is known as the sampling frame, though, unlike conventional sampling, the sample is not drawn from the frame. Traditional sampling, then, selects individuals from the sampling frame at random for participation in the study. This may not be feasible or economical as the contact information, especially email addresses, is not available for all individuals in the frame and refusals to participate increase the costs of sampling in this way.

Sample selection using the matching methodology is a two-stage process. First, a random sample is drawn from the target population. We call this sample the target sample. Details on how the target sample is drawn are provided below, but the essential idea is that this sample is a true probability sample and thus representative of the frame from which it was drawn.

Second, for each member of the target sample, we select one or more matching members from our pool of opt-in respondents. This is called the matched sample. Matching is accomplished using a large set of variables that are available in consumer and voter databases for both the target population and the opt-in panel.

The purpose of matching is to find an available respondent who is as similar as possible to the selected member of the target sample. The result is a sample of respondents who have the same measured characteristics as the target sample. Under certain conditions, described below, the matched sample will have similar properties to a true random sample. That is, the matched sample mimics the characteristics of the target sample.

When choosing the matched sample, it is necessary to find the closest matching respondent in the panel of opt-ins to each member of the target sample. YouGov employs the proximity matching method to find the closest matching respondent. For each variable used for matching, we define a distance function, $d(x,y)$, which describes how “close” the values x and y are on a particular attribute. The overall distance between a member of the target sample and a member of the panel is a weighted sum of the individual distance functions on each attribute. The weights can be adjusted for each study based upon which variables are thought to be important for that study, though, for the most part, we have not found the matching procedure to be sensitive to small adjustments of the weights. A large weight, on the other hand, forces the algorithm toward an exact match on that dimension.
